About Internship project

Translation stage control project is a mini project that part of EvWaCo project from NARIT.

Evanescent Wave Coronagraph or EvWaCo is project that study optical instruments for study about binary star system or exoplanetary system . EvWaCo aim to develop optical instruments for separate light from bright star to observe the companion star

The main idea of translation stage control project is control translation stage moving light source along horizontal axis to make the light source closest align to imaging system for get high quality image by using PID closed loop control .

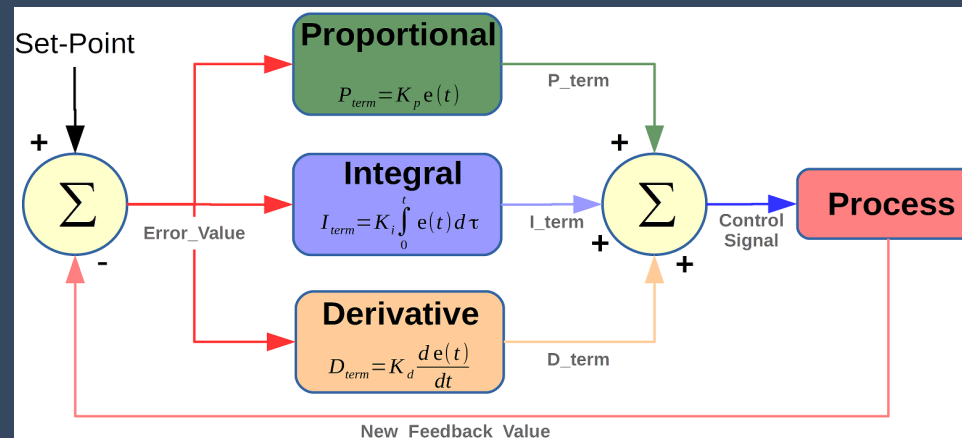

Why we use PID Control ?

- Stability and Responsiveness : The D term dampens oscillations, while the I term corrects steady-state errors, leading to a more stable system.
- Improved Accuracy : The I term ensures the system output matches the desired setpoint more precisely.
- Flexibility : PID provides three tunable parameters (K_p , K_i , K_d) to optimize performance for different systems and dynamic behaviors.

In summary, PID control offers balanced error management, enhancing stability, accuracy, and responsiveness over pure error control.

PID CONTROLLER

- Stands for "Proportional, Integral, Derivative" .
- It is closed-loop feedback control .
- instrument used by control engineers to regulate temperature, flow, pressure, speed, and other process variables in industrial control systems.

<https://microcontrollerslab.com/pid-controller-implementation-using-arduino/>

PID CONTROLLER

P : Proportional

- tuning -> correcting a target proportional to the difference
- based on the current error (setpoint - measured output of the system)

I : Integral

- tuning -> cumulating the error result from the "P" action to increase the correction factor
- Increase -> increases the contribution of the accumulated error over time to the control signal

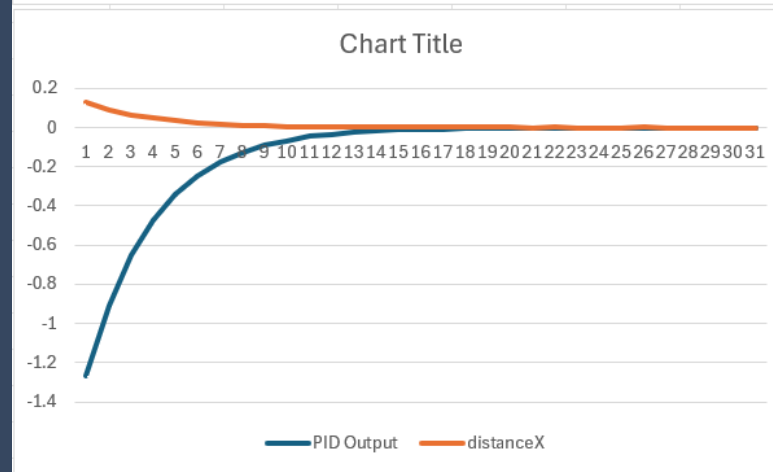

D : Derivative

- tuning -> minimize overshoot by slowing the correction factor
- reduce the rate of change of the error
- helps improve the stability and responsiveness of the control loop

PID CONTROLLER

P Controller

- Use only error term to affect the output
- simply multiply $e(t) * K_p$
- provides a linear relationship between the error of a system and the controller output of the system

PID CONTROLLER

PI Controller

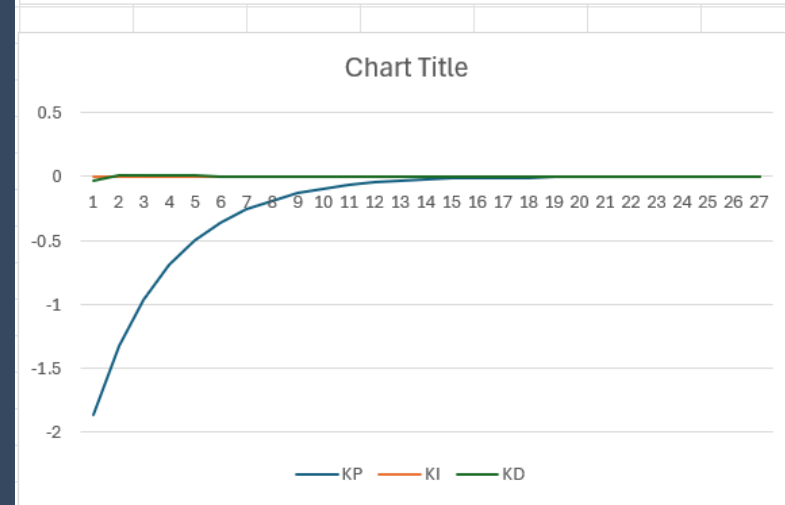

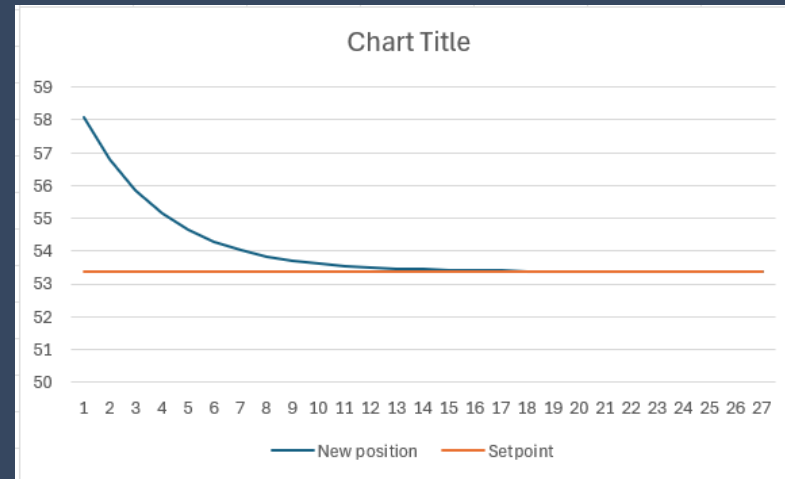

- a combination of Proportional controller action and Integral controller action
- correlates the controller output to the error and the integral of the error.
provides a faster response time than I-only control
- Eliminates steady state error

PID CONTROLLER

PD Controller

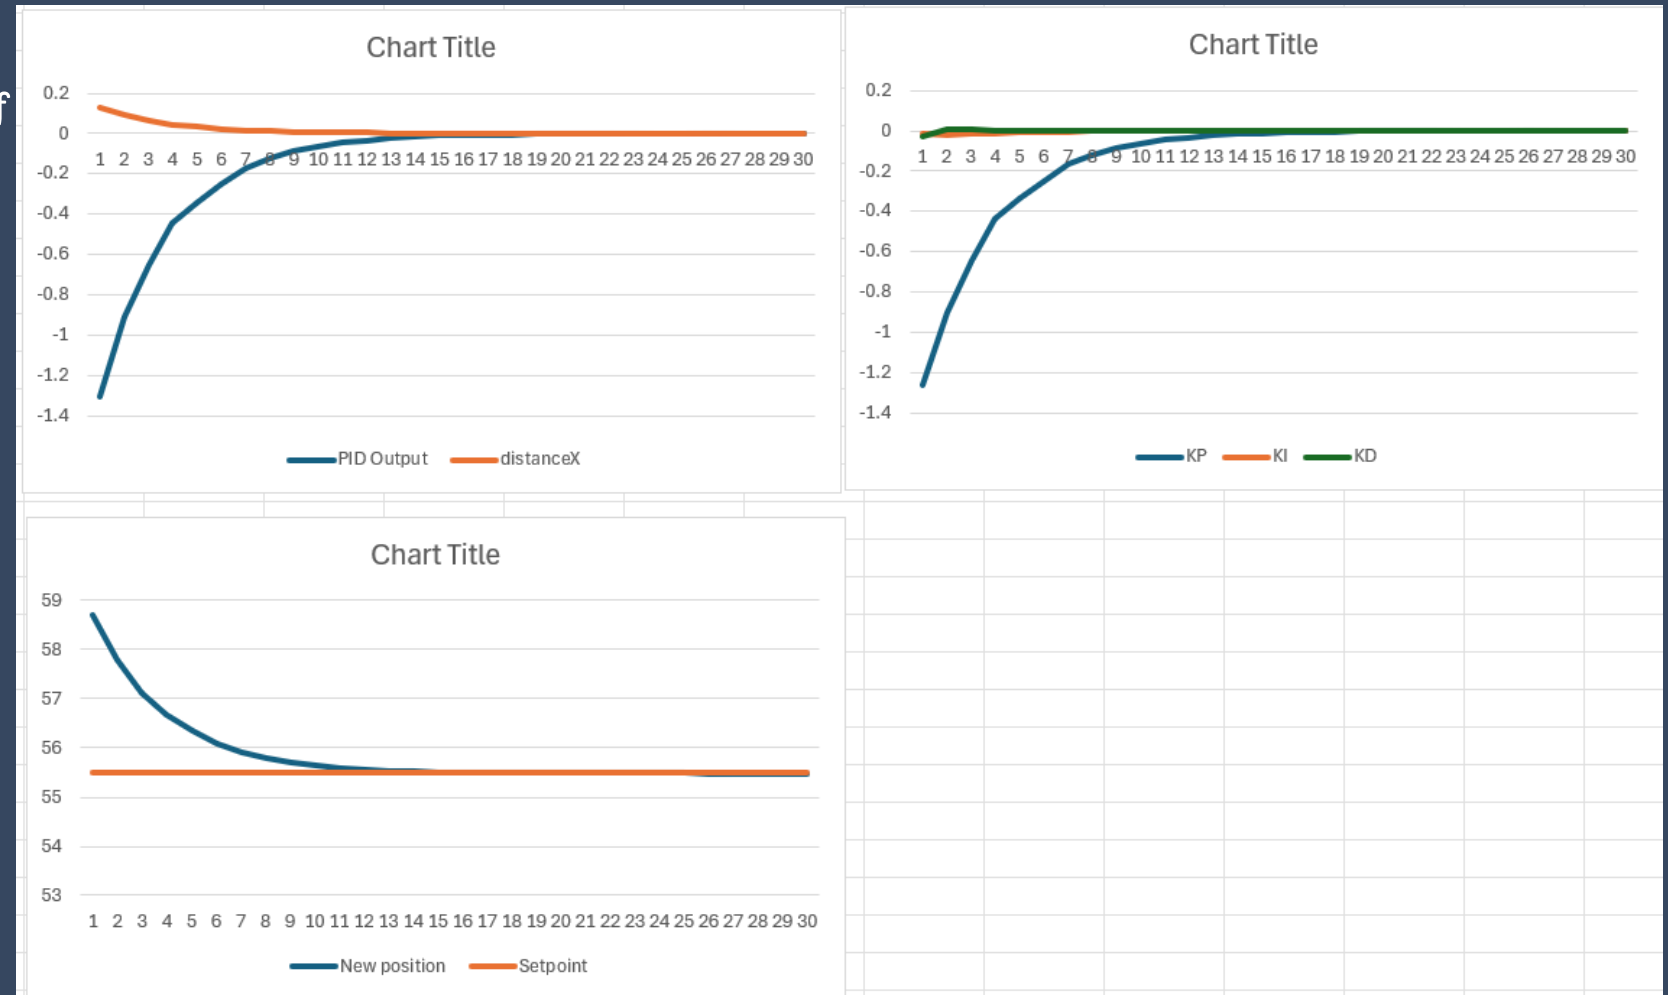

- combination of feedforward and feedback control
- contains – proportional control's damping of the fluctuation
 - derivative control's prediction of process error output
- Improves transient response, reduces overshoot

PID CONTROLLER

PID Controller

- a combination of all three types of control methods
- most commonly used
- balances steady state and transient response

- Moving translation stage into steps for find error of stage .
- Home position can't change.
- Home position is 0.0000 .
- Error of translation stage is 0.0100 - 0.0500 .

2. Capture image from camera

```
save_path_mono = r"C:\Users\Asus\Desktop\ASI1600-PRO\img\mono\\"
save_path_mono16 = r"C:\Users\Asus\Desktop\ASI1600-PRO\img\mono16\\"
asi.init('C:\\Users\\Asus\\AppData\\Local\\Programs\\Python\\Python310\\Lib\\ASI SDK\\lib\\x64\\ASICamera2.lib')
```

Try capture some
image from
ASI1600-PRO
Camera and save
images into .jpg
for mono8 and
.tiff file. For
mono16

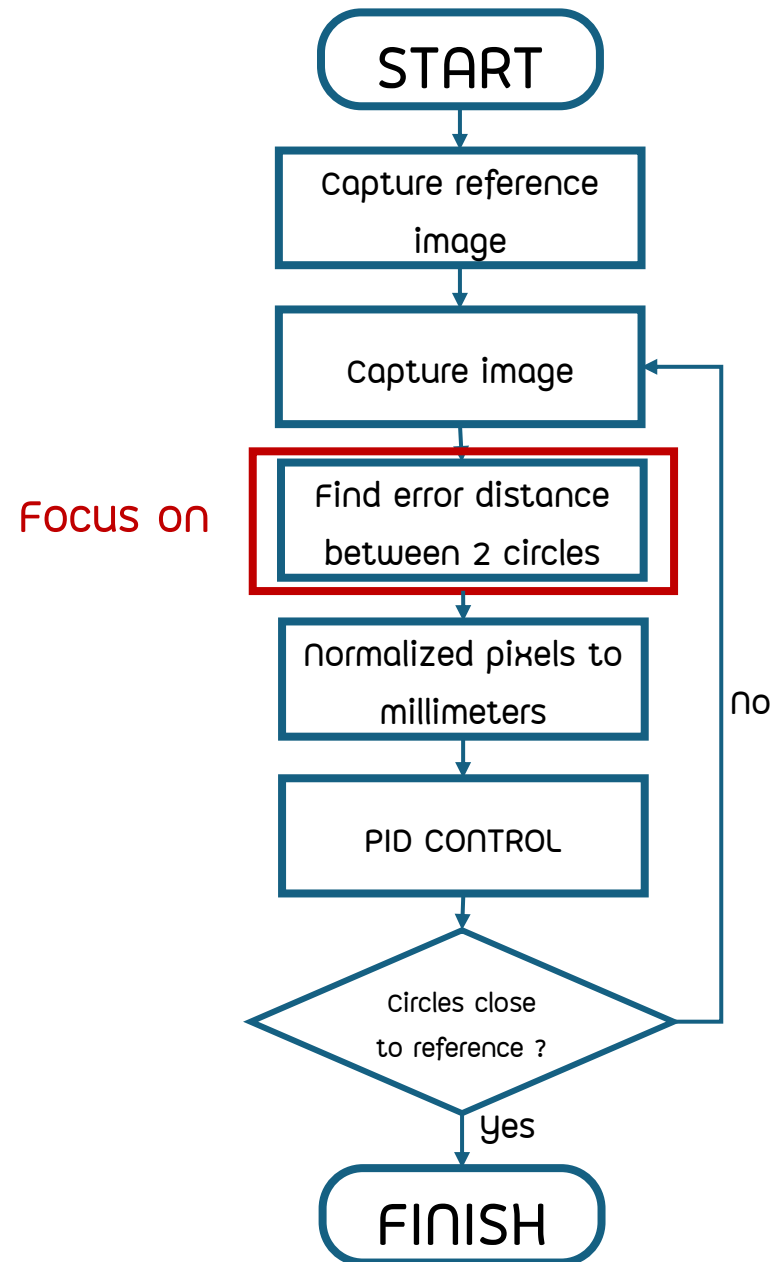

SETUP

03

Find Solution

WORKFLOW

mainly focus on

- Find distance between 2 circles
- Find solution of overlapped circles condition

3. Find center coordinates and distance of circle

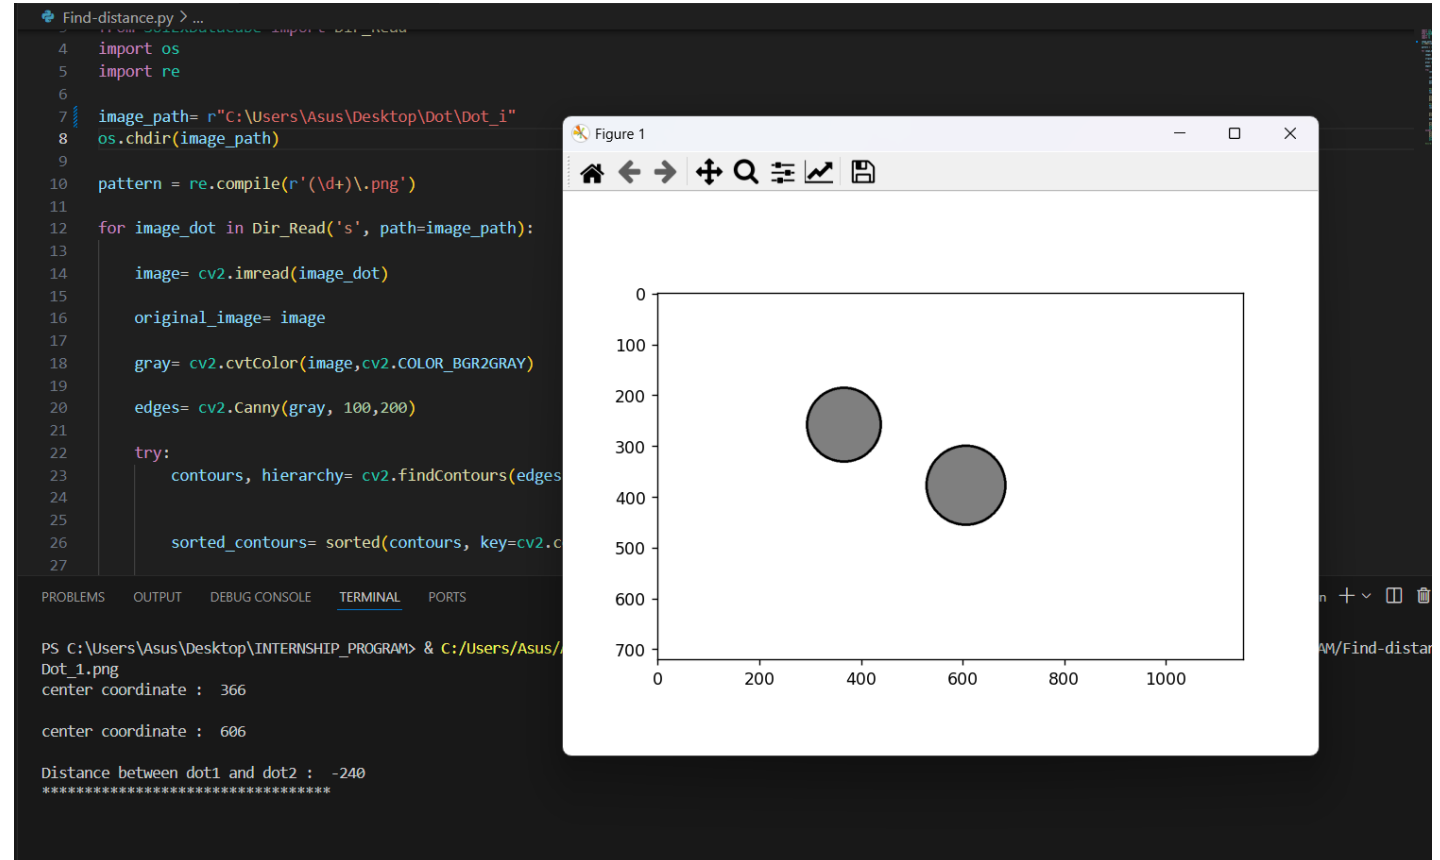

METHOD 1

1. Find center coordinates of circle by

- Using OpenCV for find edge , contour area and coordinate of center point.
- Use Matplotlib for plot circle.

2. Find distance between 2 circle by

- 1.Find coordinate of center of 2 circles
- 2.Subtrac coordinate of center of 2 circles

3. Find center coordinates and distance of circle

METHOD 1

The screenshot displays a Python IDE with three open files: `Find-Coordinate.py`, `Find-distance.py`, and `IMG_SHOW.py`. The `Find-distance.py` file contains the following code:

```
20 edges= cv2.Canny(gray, 100,200)
21
22 try:
23     contours, hierarchy= cv2.findContours(edges.copy(), cv2.RETR_EXTERNAL, cv2.CHAIN_APPROX_NONE)
24
25     sorted_contours= sorted(contours, key=cv2.contourArea)
26
27     dot1= sorted_contours[0]
28     dot2= sorted_contours[1]
29
30
31
32     #dot1
33     R1= cv2.moments(dot1)
34     coordinate_center1= int(R1['m10']/R1['m00'])
35
36     print(image_dot)
37     print("center coordinate : ", str(coordinate_center1))
38     print("")
39
40     #dot2
```

The `Find-distance.py` file also contains the following code:

```
20 edges= cv2.Canny(gray, 40,200)
21
22 try:
23     contours, hierarchy= cv2.findContours(edges.copy(), cv2.RETR_EXTERNAL, cv2.CHAIN_APPROX_NONE)
24
25     sorted_contours= sorted(contours, key=cv2.contourArea)
26
27     dot1= sorted_contours[0]
28     dot2= sorted_contours[1]
29
30
31
32     #dot1
33     R1= cv2.moments(dot1)
34     coordinate_center1= int(R1['m10']/R1['m00'])
35
```

The `IMG_SHOW.py` file contains the following code:

```
20
21
22
23
24
25
26
27

```

The IDE also shows a terminal window with the following output:

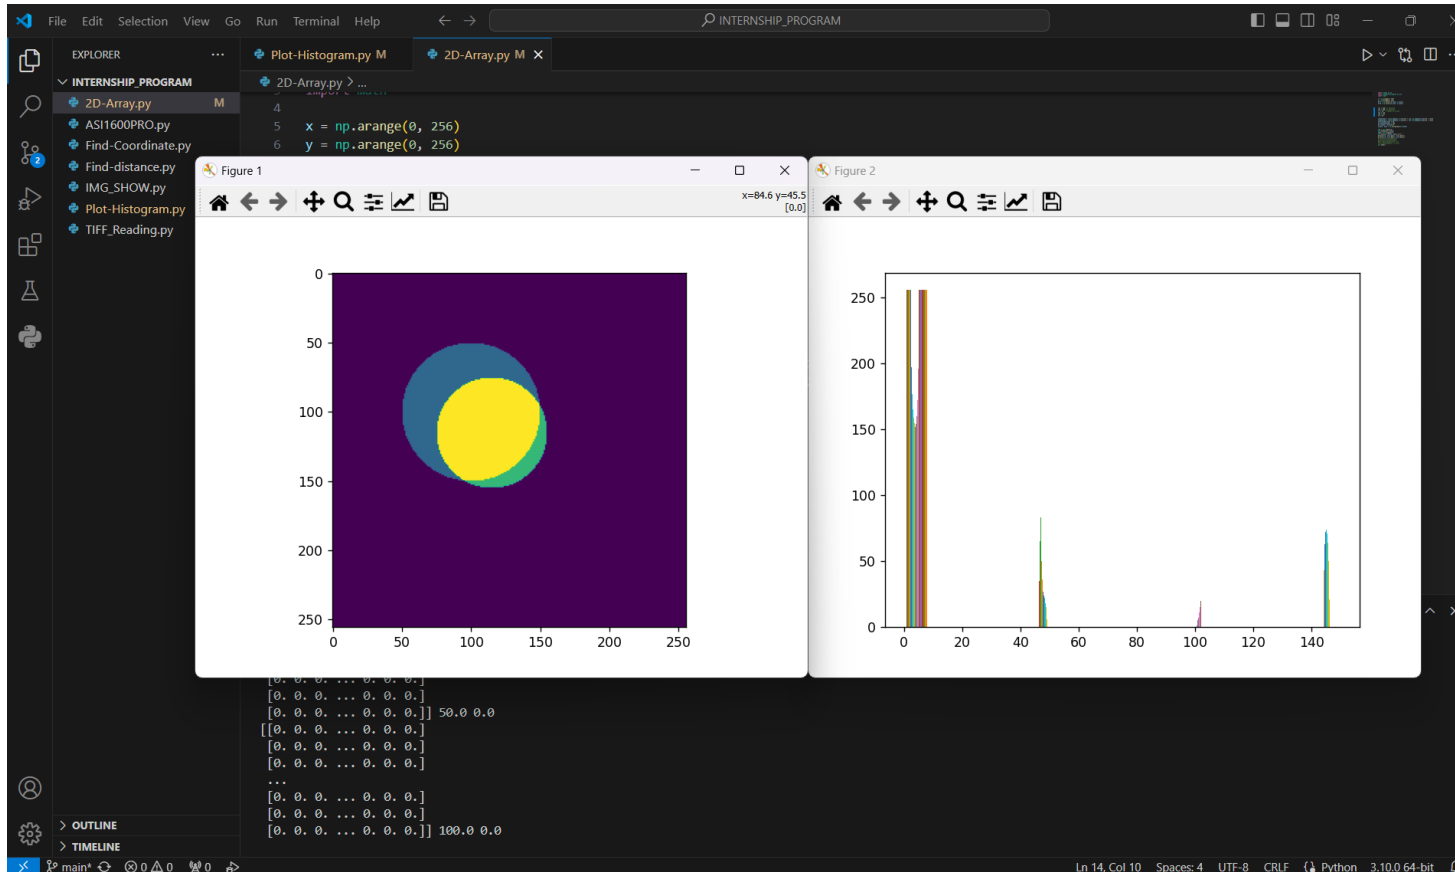

```
PS C:\Users\Asus\Desktop\INTERNSHIP_PROGRAM> & C:/Users/Asus/AppData/Local/Programs/Python/Python39-64/Python.exe C:/Users/Asus/Desktop/INTERNSHIP_PROGRAM/Find-distance.py
Dot_1.png
center coordinate : 366
center coordinate : 606
Distance between dot1 and dot2 : -240
*****
Dot_2.png
Circles are overlapping
*****
```

The image shows two overlapping circles on a white background. The circles are gray with black outlines. The first circle is located at approximately (524, 147) and the second circle is located at approximately (525, 255). The circles are overlapping, and the distance between their centers is -240.

Can't use this condition with image that has 2 circles that are overlapping

3. Find center coordinates and distance of circle

METHOD 2

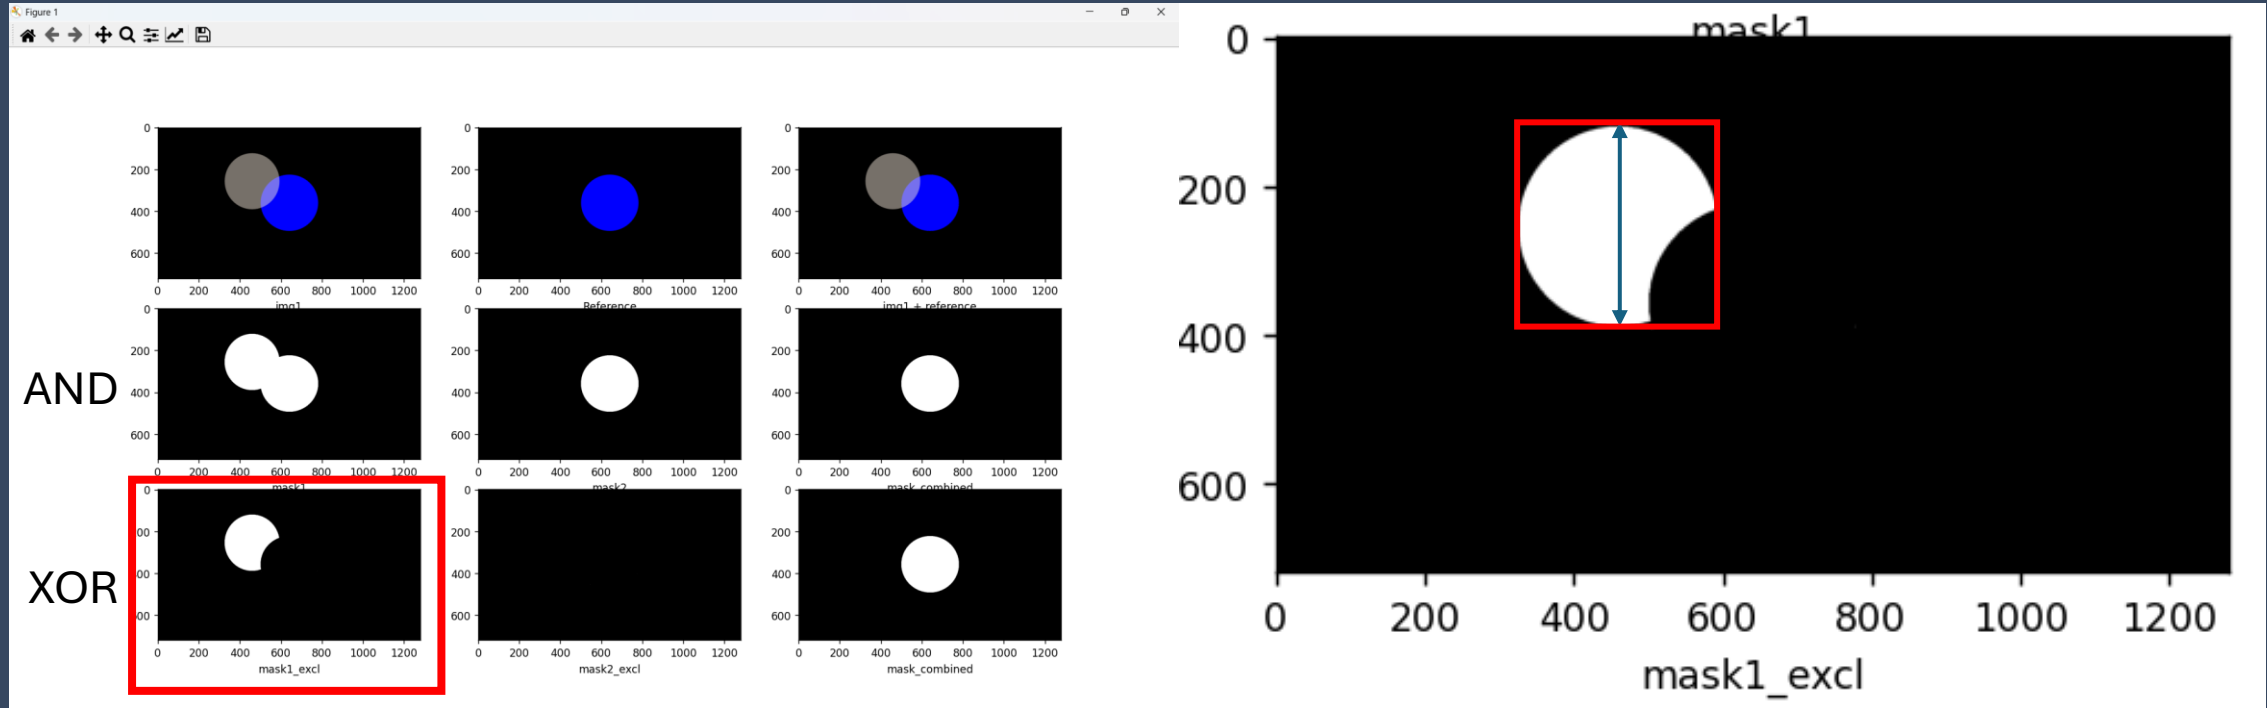

- Coding program for draw and plot circles from circle formula .
- Initialize as 2D array .
- Plot histogram for see intensity of circle

This code works for overlapped circle condition .

METHOD 3

3. Find center coordinates and distance of circle

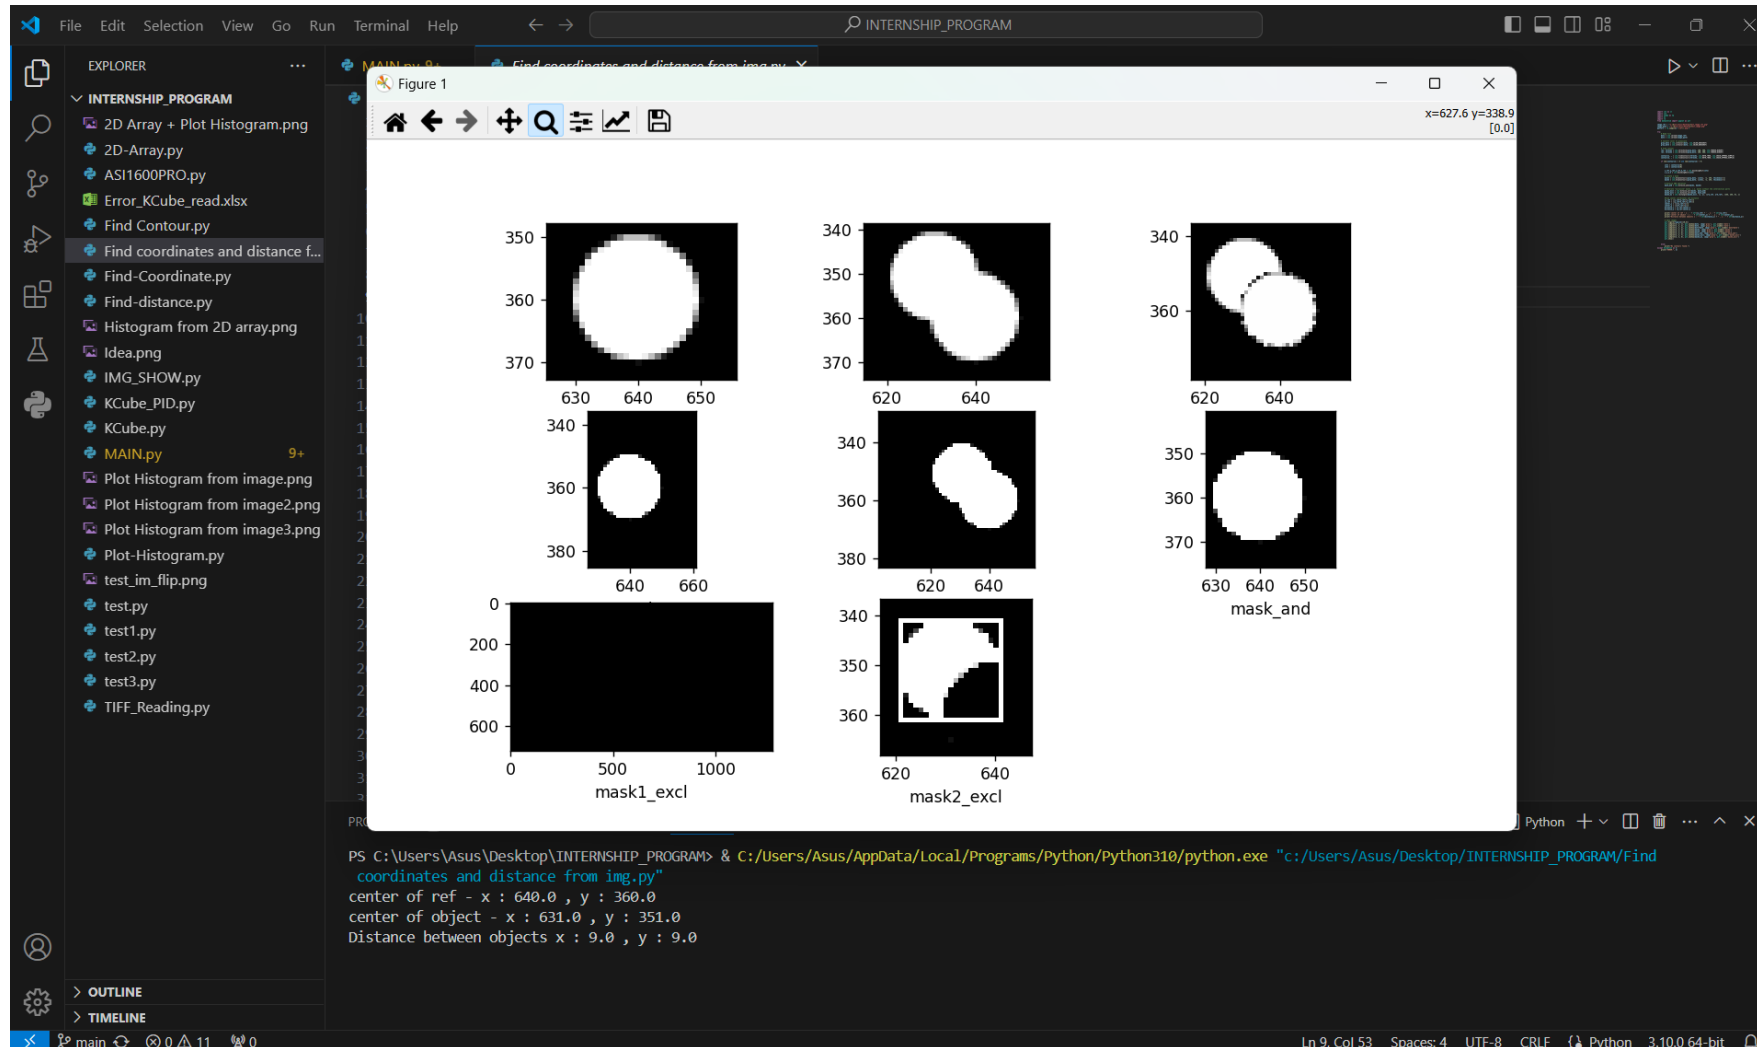

main idea of this concept is

Use bitwise operation (AND , XOR) for find contour area that not overlapping. Then draw bounding box around the area then find height and width then calculate center of the area from height and width. Then find distance between 2 center point.

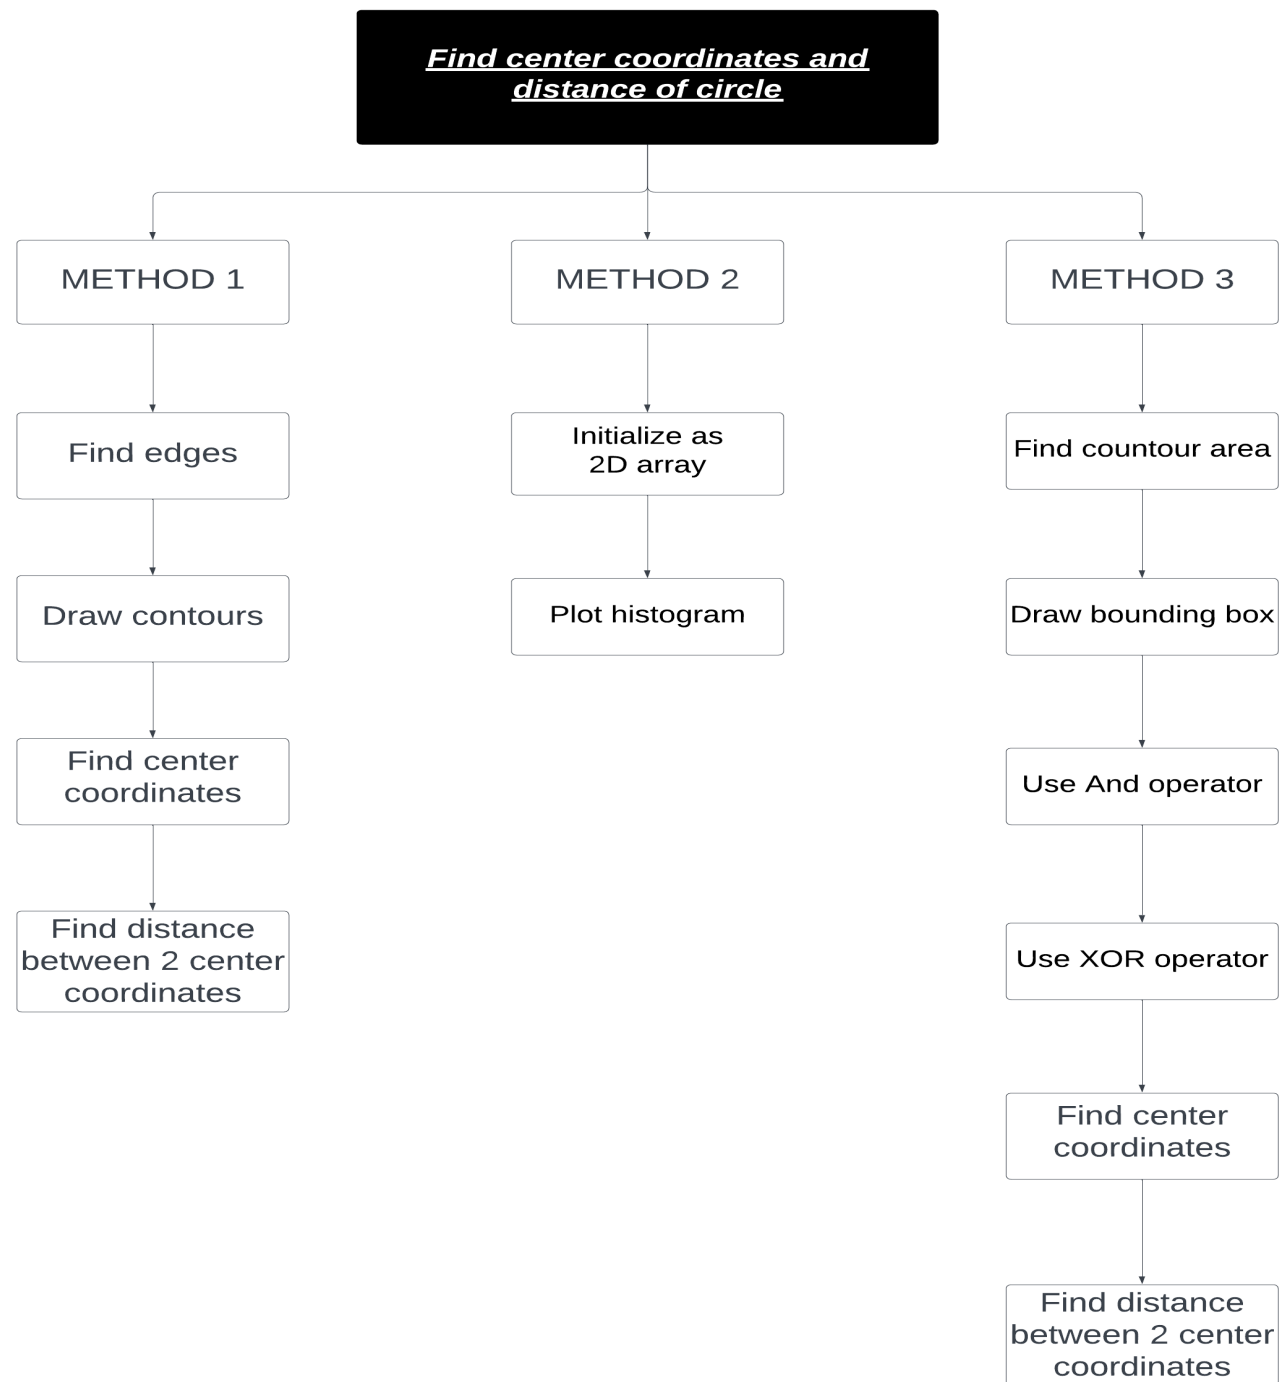

METHOD 3

3. Find center coordinates and distance of circle

OVERVIEW

MAP

METHODS	ADVENTAGES	DISVENTAGES
METHOD 1	Easy for operate	Can't use this method with overlapped images
METHOD 2	Can use this method with overlapped images	Can't find distance between 2 images.
METHOD 3	Can use this method with overlapped images	Take more time to process

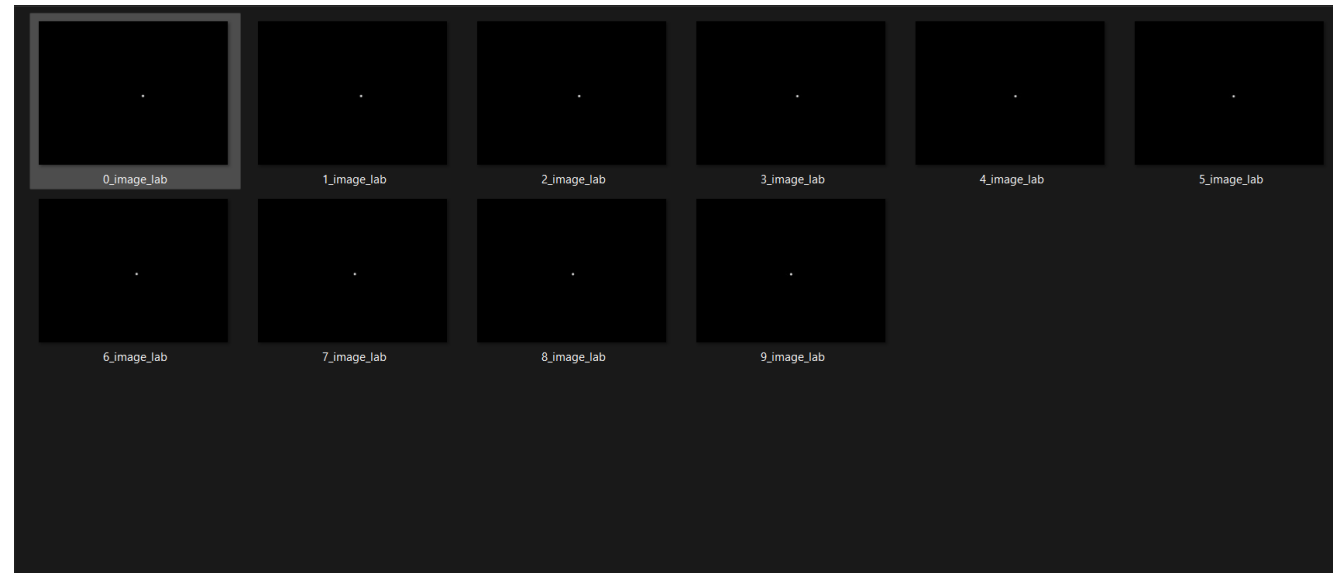

```
-----  
center of ref - x : 2253.0 , y : 1672.5  
center of object - x : 2341.0 , y : 1861.5  
Distance between objects - x : -88.0 , y : -189.0  
-----Normalize-----  
CX_ref = 8.5614  
CY_ref = 6.3555  
center_x = 8.8958  
center_Y = 7.0737  
disX = -0.3344  
disY = -0.7182  
-----
```

Normalized data from pixel to mm.

04

Experiment & Application

EXPERIMENT

Test code in lab with method 3 as solution for collect real data and find error of process of code when run in real situation.

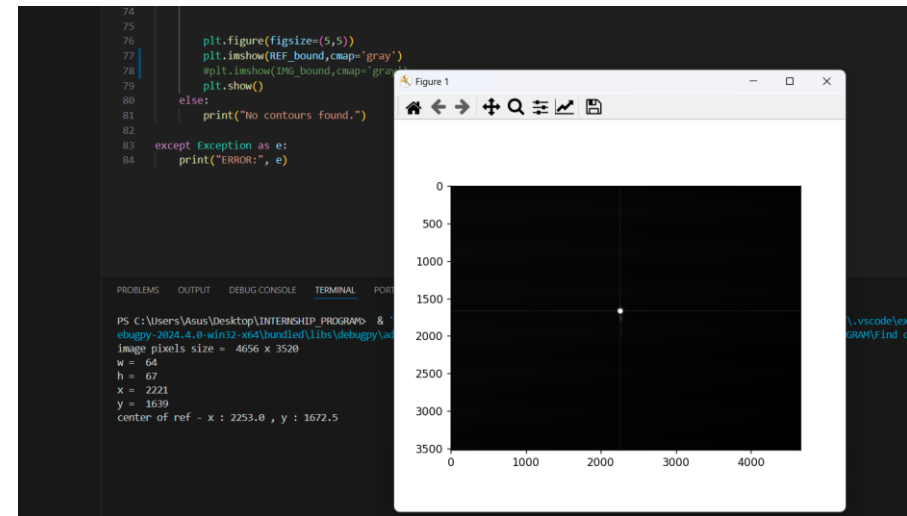

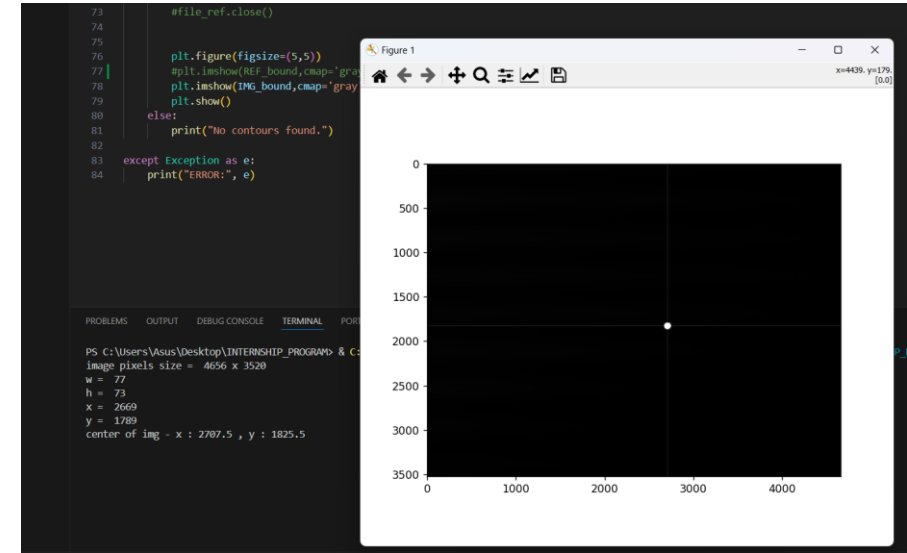

PROBLEM : Have only one light source so it can't see 2 dot in one image at the same time.

Solution

- Find centroid and position of dot both in reference image and collected image.
- Compare position of current image with reference image.

(Still use bitwise operation method in code for overlapped condition)

EXPERIMENT

PROBLEM : Program doesn't read current images that had capture . It's read and overwrite old images in directory instead .

Solution : Coding new program that has infinity loop and can read images from current images .

```
reference = Decimal(0)
for path in Dir_Read('s'):
    print("-----")
    print('Capturing image')

    if i < 10:
        filename = '00'+ str(i)+'_image_lab.png'
    else:
        filename = '0'+ str(i)+'_image_lab.png'
    camera.set_image_type(asi.ASI_IMG_RAW16)
    camera.capture(filename=save_path+filename)
    print('Saved to %s' % filename)
    print("-----")
    #capture()
    time.sleep(0.5)
    disX = Draw_Contour(path)

    err = PID(Decimal(1) , Decimal(0.08), Decimal(0.01) , reference , Decimal(disX))

    print("Error : " + str(err))
    if err > reference :
        new_position = pos-err
        kcube.MoveTo(new_position, 7000)
        print("New_position : " + str(new_position) )
    elif err < reference:
        new_position = pos+err
        kcube.MoveTo(new_position, 7000)
        print("New_position : " + str(new_position) )
    elif err == reference:
        break
    time.sleep(0.5)
    error.append(disX)

plt.plot(error)
plt.gca().invert_yaxis()
plt.show()
i = i+1
```

PROBLEM : Program read and draw wrong contour area . It's read the random tiny pixels instead of the real reference pixels . So, it's effect to calculate distance between current pixels and reference pixels.

```
image pixels size = 4656 x 3520
w_ref = 1
h_ref = 1
x_ref = 894
y_ref = 3519
w = 1
h = 1
x = 2524
y = 1937
-----
center of ref - x : 894.5 , y : 3519.5
center of object - x : 2524.5 , y : 1937.5
Distance between objects - x : -1630.0 , y : 1582.0
```

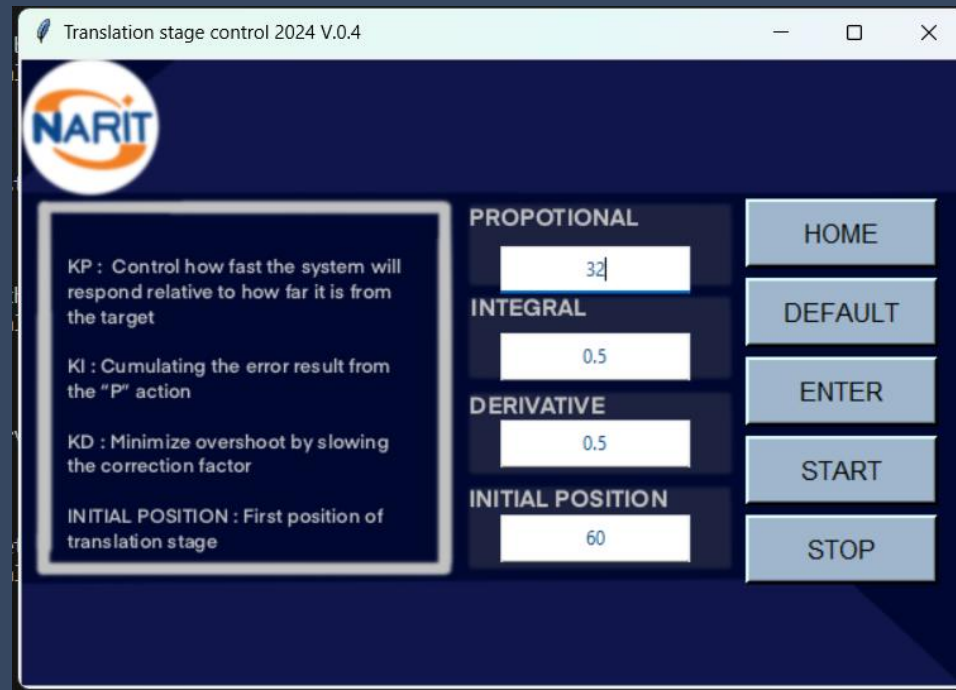

Solution : Add `max(contours1, key=cv2.contourArea)` to find and draw the biggest contour as reference pixels .

```
if len(contours1) > 0 and len(contours2) > 0:
    cnt1 = max(contours1, key=cv2.contourArea)
    cnt2 = contours2[0]

    x_ref,y_ref,w_ref,h_ref = cv2.boundingRect(cnt1)
    x,y,w,h = cv2.boundingRect(cnt2)
```

```
w_ref = 87
h_ref = 76
x_ref = 2495
y_ref = 1622
w = 60
h = 65
x = 1628
y = 1869
-----
center of ref - x : 2538.5
center of object - x : 1671.5
Distance between objects - x : 867.0
Normalize
```

Application have 2 versions

```

- Add the title of application
- Display properly dynamic range of PID parameters
- Create Stop and Home button
- Initialize the PID parameters in entry boxes
- Short describe for effect of each PID parameters

Current Version of application for users

Title of application →

Short description about PID parameters →

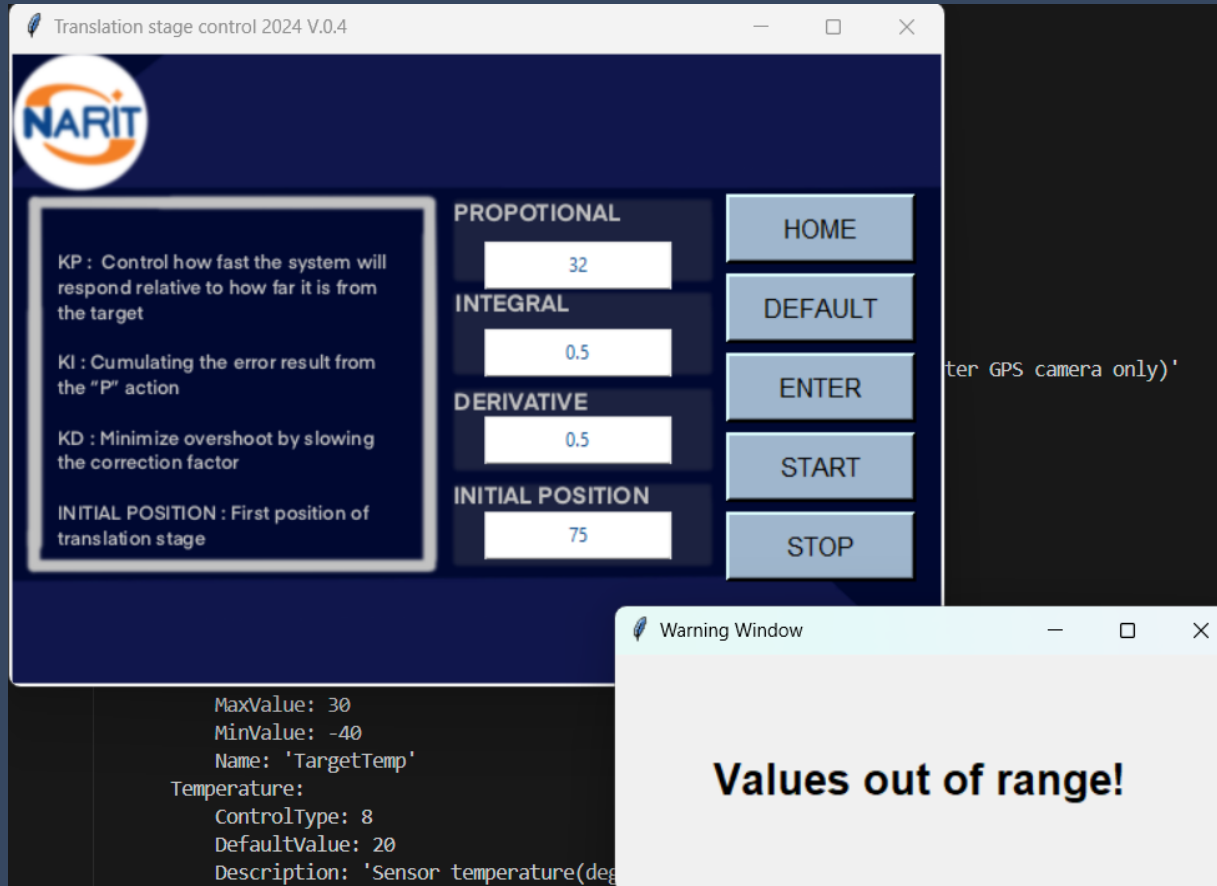

Initialized (Default) PID parameters

Add Home button

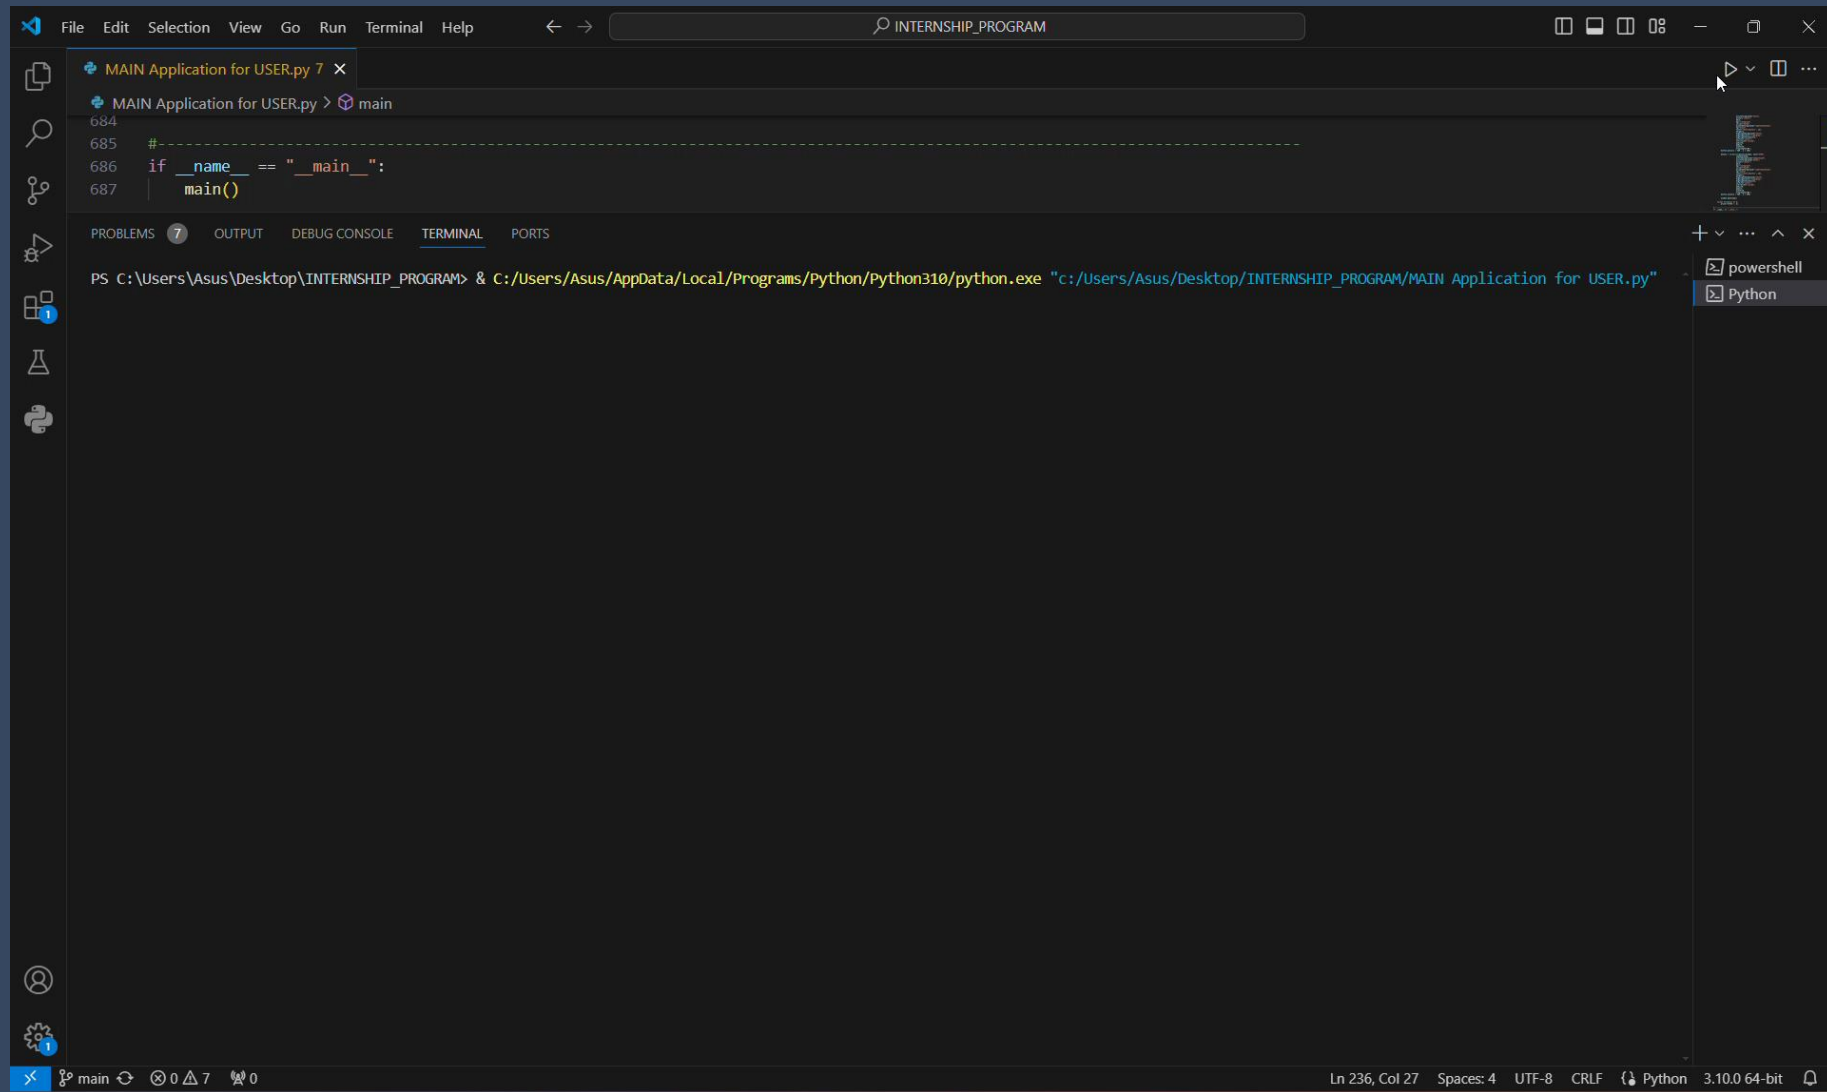

Add stop button

The application window displays the following content:

- Window Title:** Translation stage control 2024 V.0.4
- Logo:** NARIT
- Text Description:**
 - KP : Control how fast the system will respond relative to how far it is from the target
 - KI : Cumulating the error result from the "P" action
 - KD : Minimize overshoot by slowing the correction factor
 - INITIAL POSITION : First position of translation stage
- Parameter Inputs:**
 - PROPORTIONAL: 32
 - INTEGRAL: 0.5
 - DERIVATIVE: 0.5
 - INITIAL POSITION: 60
- Control Buttons:** HOME, DEFAULT, ENTER, START, STOP

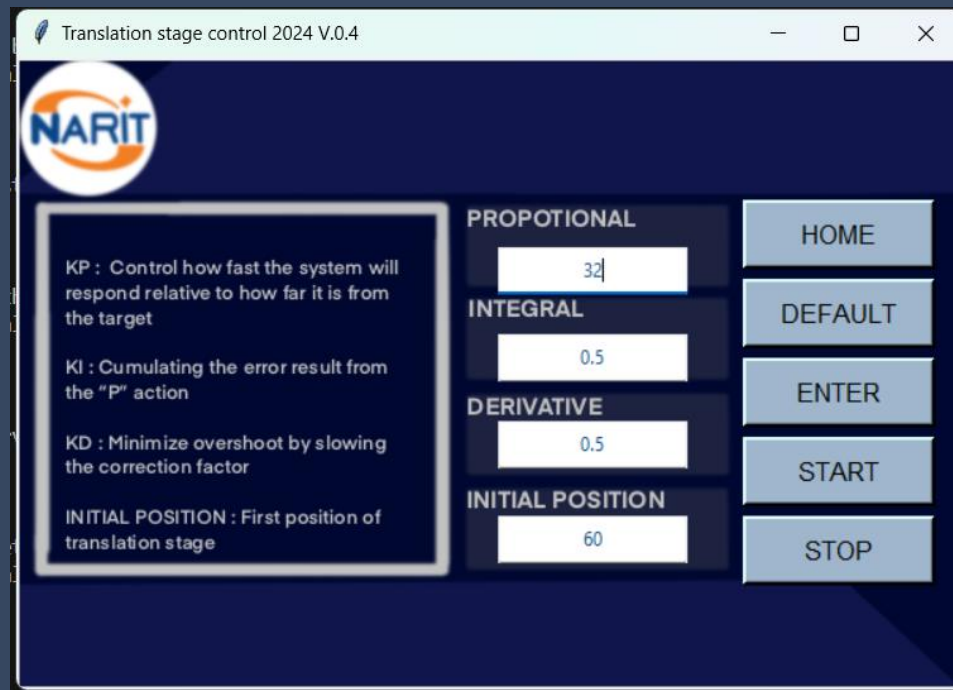

Add "Warning Window" for warning when put some values that out of range.

05

Conclusion

Both UI version and input command in terminal version work successfully.
Can control translation stage with PID closed loop control and collect images.

UI Version

```
DefaultValue: 20
Description: 'Sensor temperature(degrees Celsius)'
IsAutoSupported: False
IsWritable: False
MaxValue: 1000
MinValue: -500
Name: 'Temperature'
Do you want to change paramter ? (Y/N) : Y
Please enter kp value : 34
Please enter ki value : 2
Please enter kd value : 0.2
Please enter first position : 70
```

Command line Version

Default values of PID are :

- P : Proportional : 10
- I : Integral : 0.1
- D : Derivative : 0.2
- Initial position : 60

Application can run with the same values and the results still the same. The result is the position of current image is in the same place of reference image with 0.00 error even though change the reference position .

Reference position = 53.37

Reference position = 55.48
